Objective

- Surveys are great for collecting customer input about our product or service.
- Surveys can help gauge the representativeness of individual views and experiences.
- It provide hard number on people's opinion and behaviors that can be used to make important decisions.
- Data is instantly available and can easily be transferred into specialised statistical software or spreadsheets when more detailed analysis is needed.

Abstract

- The main aim of developing this online survey system is to conduct an online survey on different topics to the users.
- A survey is a research method used for collecting data from a group of respondents to gain information.
- Surveys have a variety of purposes and can be carried out in many ways depending on the methodology chosen and the objectives to be achieved.
- In this Java application, the user can take part in various online polls. Admin will add the polls regarding different questions and different topics and she/he can see the results.

Software requirements

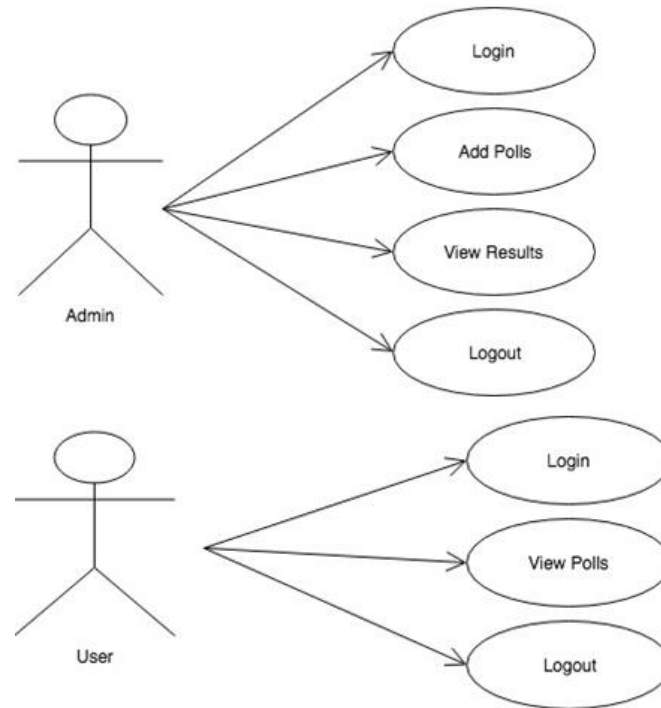

- **Operating System:** Windows or Linux
- **Language:** JAVA
- **Tools:** Eclipse, JDK and SQLYog
- **Database:** SQL

Online Survey Tools

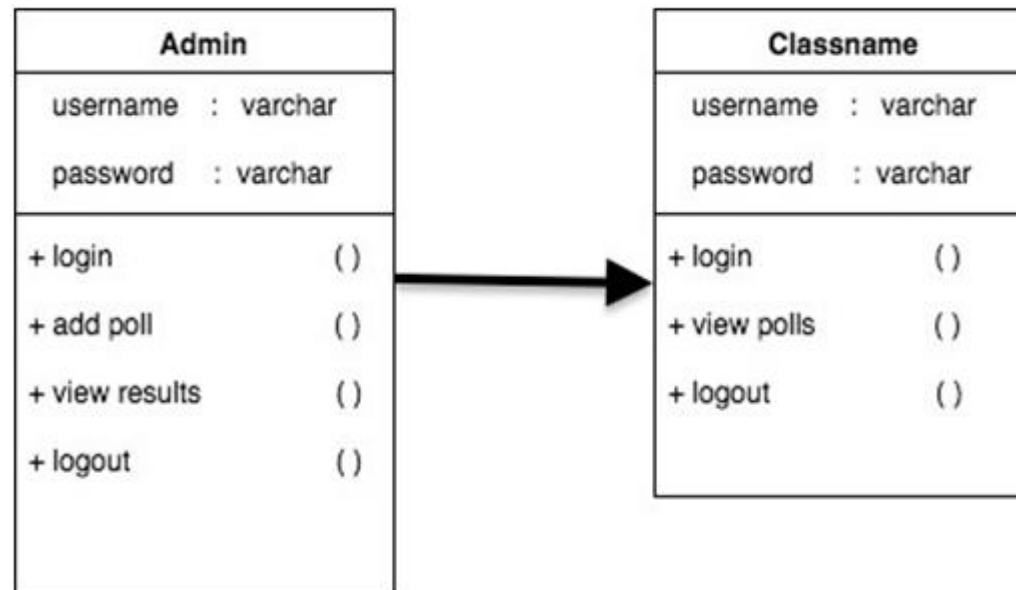

There are many popular tools for conducting online survey including

- SurveyMonkey
- Zoho Survey
- SurveyGizmo

Advantages

- High accessibility.
- Good quality control.
- Quick data processing and handling.
- Anonymous respondents.
- Cost effective.
- Faster than other methods.
- No field staff is required.

Conclusion

- Online Survey System Project in java is an excellent software to conduct online survey with minimized economy.
- The result of the project is accurate and totally error free. With this system, the whole survey process can be conducted secretly by hiding the identities of the people surveyed.
- The growing use of internet and computers confirms the good scopes of project.
- Overall, the results from this survey have showed that the information presenting on the revision website is very useful and has been effectively communicated.

Thank You
